

For this project, our team (**SWTID-2026-5458**) successfully imported and structured employee data into ServiceNow using **Import Sets** and **Transform Maps**. We uploaded the source spreadsheet containing 100 employee records to create the staging table **u_employee_staging**. Next, we configured a Table Transform Map (**Employee Data Transform Map**) targeting the standard **User** (**sys_user**) table, leveraging **Auto Map Matching** to map staging columns to target fields. To prevent duplicate entries and maintain record uniqueness, we set **u_email** as the **Coalesce** field. Running the transformation yielded **100 inserted records** with **0 errors**. To complete the project, we built a visual dashboard by navigating to **Reports > Create New**, building custom report widgets based on the imported **sys_user** dataset (categorized by department and active status), and adding these widgets onto a centralized **ServiceNow Dashboard** (**pa_dashboards**) for real-time reporting and visibility

Below i have updated the detailed steps for this project :

1. Source Data Upload & Staging Table Creation

2.

- Uploaded the source spreadsheet containing 100 employee records into ServiceNow using the **Load Data** module.
-
- Created a temporary import staging table named **u_employee_staging** to hold the raw uploaded data.
-

3. Transform Map Configuration & Field Mapping

4.

- Created a new Table Transform Map named **Employee Data Transform Map** targeting the standard ServiceNow **User** (**sys_user**) table.
-
- Utilized **Auto Map Matching Fields** to map staging attributes (such as name, department, location, phone, and active status) to target fields on the **sys_user** table.
-

5. Coalesce & Data Transformation Execution

6.

- Configured **u_email** as the **Coalesce** field (**Coalesce = true**) to serve as the unique identifier, preventing duplicate user records.
-
- Executed the transform map, resulting in **100 records inserted** into **sys_user** with **0 errors**.

-

7. Report & Dashboard Creation

8.

- Navigated to **Reports** > **Create New** to generate visual reports analyzing the newly imported dataset (e.g., employee distribution by department and active status).
-
- Built a custom **ServiceNow Dashboard** (`pa_dashboards`) and added the report widgets to provide real-time data visibility and administrative analytics.

-

9. Validation & Project Submission

10.

- Verified the transformed records directly in the `sys_user.list` view.
-
- Uploaded the project evidence, GitHub repository URL, and demo link to the SkillWallet portal for final mentor review.
